Recap

- Description and Aim:
 - Determining overall sentiment/feeling a text conveys
 - Attempts to classify the emotion or sentiment conveyed by text
 - Leverage social media data to gain insights previously unachievable
 - Mental illness detection [1], movie review sentiment detection [2]
 - Companies gauge how their products or services are received by consumers
- Term Two Work:
 - Pre-processed data
 - Developed high-level detail of implementation phase

Implementation

- Text preprocessing:
 - Pandas
 - BeautifulSoup
 - NLTK
 - Scikit learn
- Feature Extraction:
 - Term Frequency - Inverse Document Frequency
- Feature Selection:
 - Information gain using *mutual_classif_info*
- Demo creation:
 - Tkinter
 - Classes to represent each frame of prototype

Training

- Hardware:
 - Lab PC with GPU and 16GB RAM
- Model training:
 - Xgboost model trained
 - 250K samples out of 1.6M used for training
 - Grid search performed for optimum parameters
- Preliminary results:
 - F1-score 75% without feature selection
 - F1-score 76% with information gain feature selection
